JRuby and JBoss Application Server

Ruby on the JVM

Ruby?

Aren't most JBoss developers Java developers?

Java

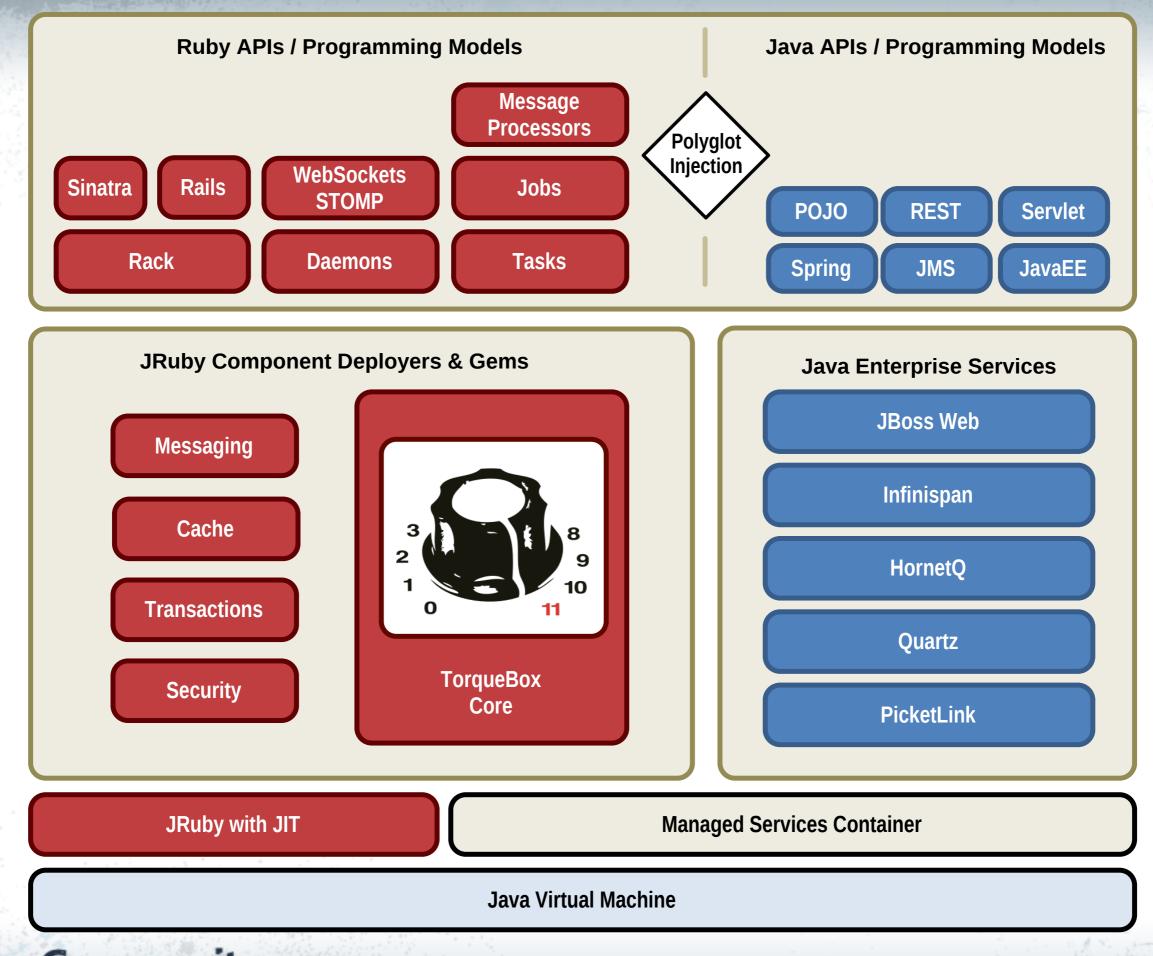

```
import java.io.RandomAccessFile;
import java.security.MessageDigest;
public class CalculateDigest {
   public static void main(String[] args) throws Exception {
        RandomAccessFile file = new RandomAccessFile(args[0], "r");
        MessageDigest shal = MessageDigest.getInstance("SHA-1");
        int bufferSize = 16384;
        byte[] buffer = new byte[bufferSize];
        long read = 0;
        long offset = file.length();
        while (read < offset) {
            long remaining = offset - read;
            int unitSize = (int) ((remaining >= bufferSize) ? bufferSize : remaining);
            file.read(buffer, 0, unitSize);
            shal.update(buffer, 0, unitSize);
            read += unitSize;
        file.close();
        byte digest[] = shal.digest();
        StringBuffer hexString = new StringBuffer();
        for (int i = 0; i < digest.length; i++) {</pre>
            hexString.append(Integer.toHexString(0xFF & digest[i]));
        System.out.println("SHA1 digest is " + hexString);
```

JBoss Community

Ruby

```
require 'digest/sha1'
sha1 = Digest::SHA1.new
buffer_size = 16384
File.open(ARGV.first, 'r') do |file|
    sha1.update(file.read(buffer_size)) until file.eof?
end
puts "SHA1 digest is #{sha1.hexdigest}"
```

- Rails, Sinatra, and Rack applications
- Messaging
- Scheduled Jobs
- Daemons
- Caching
- Clustering
- WebSockets / STOMP
- Supported by Red Hat

TorqueBox usage

bbrowning@bbrowning-mbp:~\$ torquebox deploy ~/my_ruby_app

```
into: /Users/bbrowning/Downloads/torquebox-current/jboss/standalone/deployments
bbrowning@bbrowning-mbp:~$ torquebox run

13:07:42,920 INFO [org.torquebox.core.runtime] (MSC service thread 1-1) Created ruby runtime
  (ruby_version: RUBY1_8, compile_mode: JIT, app: my_ruby_app, context: web) in 0.87s
13:07:43,004 INFO [org.jboss.web] (MSC service thread 1-4) JBAS018210: Registering web context:
13:07:43,065 INFO [org.jboss.as.server] (DeploymentScanner-threads - 1) JBAS018559: Deployed
```

"my_ruby_app-knob.yml"

Deployed: my_ruby_app-knob.yml

(localhost:8080

You're riding Ruby on Rails!

About your application's environment

Getting started

Here's how to get rolling:

 Use rails generate to create your models and controllers

To see all available options, run it without parameters.

Set up a default route and remove public/index.html

Routes are set up in config/routes.rb.

3. Create your database

Run rake db:create to create your database. If you're not using SQLite (the default), edit *config/database.yml* with your username and password.
